Scan Report

October 31, 2025

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone “Coordinated Universal Time”, which is abbreviated “UTC”. The task was “White box - Task”. The scan started at Fri Oct 31 04:12:18 2025 UTC and ended at Fri Oct 31 05:05:01 2025 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1 Result Overview

Host	High	Medium	Low	Log	False Positive
192.168.200.5	15	28	4	0	0
Total: 1	15	28	4	0	0

Vendor security updates are not trusted.
Overrides are off. Even when a result has an override, this report uses the actual threat of the result.
Information on overrides is included in the report.
Notes are included in the report.
This report might not show details of all issues that were found.
Issues with the threat level “Log” are not shown.
Issues with the threat level “Debug” are not shown.
Issues with the threat level “False Positive” are not shown.
Only results with a minimum QoD of 70 are shown.

This report contains all 47 results selected by the filtering described above. Before filtering there were 498 results.

1.1 Host Authentications

Host	Protocol	Result	Port/User
192.168.200.5	SSH	Failure	Protocol SSH, Port 22, User msfadmin : Login failure
192.168.200.5	SMB	Success	Protocol SMB, Port 445, User

2 Results per Host

2.1 192.168.200.5

Host scan start	Fri Oct 31 04:18:19 2025 UTC

NVT: vsftpd Compromised Source Packages Backdoor Vulnerability

Summary
vsftpd is prone to a backdoor vulnerability.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Attackers can exploit this issue to execute arbitrary commands in the context of the application. Successful attacks will compromise the affected application.

Solution:
Solution type: VendorFix
The repaired package can be downloaded from the referenced vendor homepage. Please validate the package with its signature.

Affected Software/OS
The vsftpd 2.3.4 source package downloaded between 20110630 and 20110703 is affected.

Vulnerability Insight
The tainted source package contains a backdoor which opens a shell on port 6200/tcp.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Method
Details: `vsftpd Compromised Source Packages Backdoor Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.103185

[return to 192.168.200.5]

2.1.2 High 6697/tcp

High (CVSS: 8.1)

NVT: UnrealIRCd Authentication Spoofing Vulnerability

Product detection result

```
cpe:/a:unrealircd:unrealircd:3.2.8.1
Detected by UnrealIRCd Detection (OID: 1.3.6.1.4.1.25623.1.0.809884)
```

Summary
UnrealIRCd is prone to authentication spoofing vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 3.2.8.1
Fixed version:     3.2.10.7
```

Impact
Successful exploitation of this vulnerability will allows remote attackers to spoof certificate fingerprints and consequently log in as another user.

Solution:
Solution type: VendorFix
Upgrade to UnrealIRCd 3.2.10.7, or 4.0.6, or later.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

UnrealIRCd before 3.2.10.7 and 4.x before 4.0.6.

Vulnerability Insight

The flaw exists due to an error in the 'm_authenticate' function in 'modules/m_sasl.c' script.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `UnrealIRCd Authentication Spoofing Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.809883

High (CVSS: 7.4)

NVT: SSL/TLS: OpenSSL CCS Man in the Middle Security Bypass Vulnerability

Summary
OpenSSL is prone to a security bypass vulnerability.

Quality of Detection (QoD): 70%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Successfully exploiting this issue may allow attackers to obtain sensitive information by conducting a man-in-the-middle attack. This may lead to other attacks.

Solution:
Solution type: VendorFix
Updates are available. Please see the references for more information.

Affected Software/OS
OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m and 1.0.1 before 1.0.1h.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

OpenSSL does not properly restrict processing of ChangeCipherSpec messages, which allows man-in-the-middle attackers to trigger use of a zero-length master key in certain OpenSSL-to-OpenSSL communications, and consequently hijack sessions or obtain sensitive information, via a crafted TLS handshake, aka the 'CCS Injection' vulnerability.

Vulnerability Detection Method

Send two SSL ChangeCipherSpec request and check the response.

Details: `SSL/TLS: OpenSSL CCS Man in the Middle Security Bypass Vulnerability`

2.1.4 High 8787/tcp

High (CVSS: 10.0)

NVT: Distributed Ruby (dRuby/DRb) Multiple RCE Vulnerabilities

Summary
Systems using Distributed Ruby (dRuby/DRb), which is available in Ruby versions 1.6 and later, may permit unauthorized systems to execute distributed commands.

Quality of Detection (QoD): 99%

Vulnerability Detection Result

```
The service is running in $SAFE >= 1 mode. However it is still possible to run a
↪rbitrary syscall commands on the remote host. Sending an invalid syscall the s
↪ervice returned the following response:
Flo:Errno::ENOSYS:bt["3/usr/lib/ruby/1.8/drb/drb.rb:1555:in ‘syscall’"0/usr/lib/
↪ruby/1.8/drb/drb.rb:1555:in ‘send’"4/usr/lib/ruby/1.8/drb/drb.rb:1555:in ‘__se
↪nd__’"A/usr/lib/ruby/1.8/drb/drb.rb:1555:in ‘perform_without_block’"3/usr/lib/
↪ruby/1.8/drb/drb.rb:1515:in ‘perform’"5/usr/lib/ruby/1.8/drb/drb.rb:1589:in ‘m
↪ain_loop’"0/usr/lib/ruby/1.8/drb/drb.rb:1585:in ‘loop’"5/usr/lib/ruby/1.8/drb/
↪drb.rb:1585:in ‘main_loop’"1/usr/lib/ruby/1.8/drb/drb.rb:1581:in ‘start’"5/usr
↪/lib/ruby/1.8/drb/drb.rb:1581:in ‘main_loop’"//usr/lib/ruby/1.8/drb/drb.rb:143
↪0:in ‘run’"1/usr/lib/ruby/1.8/drb/drb.rb:1427:in ‘start’"//usr/lib/ruby/1.8/dr
↪b/drb.rb:1427:in ‘run’"6/usr/lib/ruby/1.8/drb/drb.rb:1347:in ‘initialize’"//us
↪r/lib/ruby/1.8/drb/drb.rb:1627:in ‘new’"9/usr/lib/ruby/1.8/drb/drb.rb:1627:in
↪‘start_service’"%/usr/sbin/druby_timeserver.rb:12:errnoi+:mesg"Function not im
↪plemented
```

Impact
By default, Distributed Ruby does not impose restrictions on allowed hosts or set the $SAFE environment variable to prevent privileged activities. If other controls are not in place, especially if the Distributed Ruby process runs with elevated privileges, an attacker could execute arbitrary system commands or Ruby scripts on the Distributed Ruby server. An attacker may need to know only the URI of the listening Distributed Ruby server to submit Ruby commands.

Solution:
Solution type: Mitigation
Administrators of environments that rely on Distributed Ruby should ensure that appropriate controls are in place. Code-level controls may include:
- Implementing taint on untrusted input
- Setting $SAFE levels appropriately (>=2 is recommended if untrusted hosts are allowed to submit Ruby commands, and >=3 may be appropriate)
- Including drb/acl.rb to set ACLEntry to restrict access to trusted hosts

Vulnerability Detection Method
Send a crafted command to the service and check for a remote command execution via the instance_eval or syscall requests.

NVT: FTP Brute Force Logins With Default Credentials Reporting

Summary
It was possible to login into the remote FTP server using weak/known credentials.

Quality of Detection (QoD): 95%

Vulnerability Detection Result

```
It was possible to login with the following credentials <User>:<Password>
msfadmin:msfadmin
postgres:postgres
service:service
user:user
```

Impact
This issue may be exploited by a remote attacker to e.g. gain access to sensitive information or modify system configuration.

Solution:
Solution type: Mitigation
Change the password as soon as possible.

Vulnerability Insight
The following devices are / software is known to be affected:
- CVE-2001-1594: Codonics printer FTP service as used in GE Healthcare eNTEGRA P&R
- CVE-2013-7404: GE Healthcare Discovery NM 750b
- CVE-2014-9198: Schneider Electric ETG3000 FactoryCast HMI gateways
- CVE-2015-7261: QNAP iArtist Lite distributed with QNAP Signage Station
- CVE-2016-8731: Foscam C1 devices
- CVE-2017-8218: vsftpd on TP-Link C2 and C20i devices
- CVE-2018-9068: IMM2 for IBM and Lenovo System x
- CVE-2018-17771: Ingenico Telium 2 PoS terminals
- CVE-2018-19063, CVE-2018-19064: Foscam C2 and Opticam i5 devices
Note: As the VT 'FTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108717) might run into a timeout the actual reporting of this vulnerability takes place in this VT instead.

2.1.7 High general/tcp

High (CVSS: 10.0)

NVT: Operating System (OS) End of Life (EOL) Detection

Product detection result

```
cpe:/o:canonical:ubuntu_linux:8.04
Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0
↪.105937)
```

Summary

The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Ubuntu" Operating System on the remote host has reached the end of life.
CPE:                cpe:/o:canonical:ubuntu_linux:8.04
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version,
build or SP:       8.04
EOL date:          2013-05-09
EOL info:          https://wiki.ubuntu.com/Releases
```

Impact
An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: Mitigation
Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.
Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method
Checks if an EOL version of an OS is present on the target host.

```

Solution:
Solution type: VendorFix
- Update Apache Tomcat to version 7.0.100, 8.5.51, 9.0.31 or later
- For other products using Tomcat please contact the vendor for more information on fixed versions

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

Apache Tomcat versions prior 7.0.100, 8.5.51 or 9.0.31 when the AJP connector is enabled. Other products like JBoss or Wildfly which are using Tomcat might be affected as well.

Vulnerability Insight

Apache Tomcat server has a file containing vulnerability, which can be used by an attacker to read or include any files in all webapp directories on Tomcat, such as webapp configuration files or source code.

Vulnerability Detection Method

Sends a crafted AJP request and checks the response.
Details: `Apache Tomcat AJP RCE Vulnerability (Ghostcat) - Active Check`
OID:1.3.6.1.4.1.25623.1.0.143545
Version used: `2025-07-11T05:42:17Z`

[return to 192.168.200.5]

2.1.9 High 80/tcp

High (CVSS: 10.0)

NVT: TWiki XSS and Command Execution Vulnerabilities

. . . continues on next page . . .

. . . continued from previous page . . .

Summary

TWiki is prone to Cross-Site Scripting (XSS) and Command Execution Vulnerabilities.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 01.Feb.2003
Fixed version:     4.2.4
```

Impact

Successful exploitation could allow execution of arbitrary script code or commands. This could let attackers steal cookie-based authentication credentials or compromise the affected application.

Solution:

Solution type: VendorFix

Upgrade to version 4.2.4 or later.

Affected Software/OS

TWiki, TWiki version prior to 4.2.4.

Vulnerability Insight

The flaws are due to:

- %URLPARAM}}% variable is not properly sanitized which lets attackers conduct cross-site scripting attack.

- %SEARCH}}% variable is not properly sanitised before being used in an eval() call which lets the attackers execute perl code through eval injection attack.

Vulnerability Detection Method

Details: `TWiki XSS and Command Execution Vulnerabilities`

OID:1.3.6.1.4.1.25623.1.0.800320

Version used: `2024-03-01T14:37:10Z`

it was possible to execute the "<?php phpinfo();?>" command.
Result:
  <title>phpinfo()</title><meta name="ROBOTS" content="NOINDEX,NOFOLLOW,NOARCHIV
↪E" /></head>
  <tr><td class="e">Configuration File (php.ini) Path </td><td class="v">/etc/ph
↪p5/cgi </td></tr>
  <h2>PHP Variables</h2>
```

Impact

Exploiting this issue allows remote attackers to view the source code of files in the context of the server process. This may allow the attacker to obtain sensitive information and to run arbitrary PHP code on the affected computer. Other attacks are also possible.

Solution:

Solution type: VendorFix

PHP: Update to version 5.3.13, 5.4.3 or later

- Other products / applications: Please contact the vendor for a solution

Affected Software/OS

PHP versions prior to 5.3.13 and 5.4.x prior to 5.4.3.

Other products / applications might be affected by the tested CVE-2012-1823 as well.

Vulnerability Insight

When PHP is used in a CGI-based setup (such as Apache's mod_cgid), the php-cgi receives a processed query string parameter as command line arguments which allows command-line switches, such as -s, -d or -c to be passed to the php-cgi binary, which can be exploited to disclose source code and obtain arbitrary code execution.

An example of the -s command, allowing an attacker to view the source code of index.php is below:

http://example.com/index.php?-s

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Method
Send multiple a crafted HTTP POST requests and checks the responses.
Note: This script checks for the presence of CVE-2012-1823 which indicates that the system is also affected by the other included CVEs.
Details: `PHP < 5.3.13, 5.4.x < 5.4.3 Multiple Vulnerabilities - Active Check`

```

High (CVSS: 7.5)

NVT: Test HTTP dangerous methods

Summary
Misconfigured web servers allows remote clients to perform dangerous HTTP methods such as PUT and DELETE.

Quality of Detection (QoD): 99%

Vulnerability Detection Result

```
We could upload the following files via the PUT method at this web server:
http://192.168.200.5/dav/puttest951918019.html
We could delete the following files via the DELETE method at this web server:
http://192.168.200.5/dav/puttest951918019.html
```

Impact
- Enabled PUT method: This might allow an attacker to upload and run arbitrary code on this web server.

. . . continues on next page . . .

. . . continued from previous page . . .

- Enabled DELETE method: This might allow an attacker to delete additional files on this web server.

Solution:
Solution type: Mitigation
Use access restrictions to these dangerous HTTP methods or disable them completely.

Affected Software/OS
Web servers with enabled PUT and/or DELETE methods.

Vulnerability Detection Method
Checks if dangerous HTTP methods such as PUT and DELETE are enabled and can be misused to upload or delete files.
Details: `Test HTTP dangerous methods`
OID:1.3.6.1.4.1.25623.1.0.10498
Version used: `2023-08-01T13:29:10Z`

[return to 192.168.200.5]

2.1.10 High 3632/tcp

High (CVSS: 9.3)

NVT: DistCC RCE Vulnerability (CVE-2004-2687)

Summary
DistCC is prone to a remote code execution (RCE) vulnerability.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
```
It was possible to execute the "id" command.
Result: uid=1(daemon) gid=1(daemon)
```

Impact
DistCC by default trusts its clients completely that in turn could allow a malicious client to execute arbitrary commands on the server.

Solution:
Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Vendor updates are available. Please see the references for more information.
For more information about DistCC's security see the references.

Vulnerability Insight
DistCC 2.x, as used in XCode 1.5 and others, when not configured to restrict access to the server port, allows remote attackers to execute arbitrary commands via compilation jobs, which are executed by the server without authorization checks.

Vulnerability Detection Method
Details: `DistCC RCE Vulnerability (CVE-2004-2687)`
OID:1.3.6.1.4.1.25623.1.0.103553
Version used: `2022-07-07T10:16:06Z`

References

```
cve: CVE-2004-2687

```

[return to 192.168.200.5]

2.1.11 High 5900/tcp

High (CVSS: 9.0)

NVT: VNC Brute Force Login

Summary
Try to log in with given passwords via VNC protocol.

Quality of Detection (QoD): 95%

Vulnerability Detection Result

```
It was possible to connect to the VNC server with the password: password
```

Solution:
Solution type: Mitigation
Change the password to something hard to guess or enable password protection at all.

Vulnerability Insight
This script tries to authenticate to a VNC server with the passwords set in the password preference. It will also test and report if no authentication / password is required at all.

. . . continues on next page . . .

. . . continued from previous page . . .

Note: Some VNC servers have a blacklisting scheme that blocks IP addresses after five unsuccessful connection attempts for a period of time. The script will abort the brute force attack if it encounters that it gets blocked.
Note as well that passwords can be max. 8 characters long.

Vulnerability Detection Method
Details: `VNC Brute Force Login`
OID:1.3.6.1.4.1.25623.1.0.106056
Version used: `2021-07-23T07:56:26Z`

[return to 192.168.200.5]

2.1.12 Medium 5432/tcp

Medium (CVSS: 5.9)

NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Product detection result

```
cpe:/a:ietf:transport_layer_security:1.0
Detected by SSL/TLS: Version Detection (OID: 1.3.6.1.4.1.25623.1.0.105782)
```

Summary
It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

Quality of Detection (QoD): 98%

Vulnerability Detection Result

```
In addition to TLSv1.0+ the service is also providing the deprecated SSLv3 proto
↪col and supports one or more ciphers. Those supported ciphers can be found in
↪the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.8020
↪67) VT.
```

Impact
An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.
Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:
Solution type: Mitigation

. . . continues on next page . . .

. . . continued from previous page . . .

It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols.
Please see the references for more resources supporting you with this task.

Affected Software/OS
All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.

Vulnerability Insight
The SSLv2 and SSLv3 protocols contain known cryptographic flaws like:
- CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE)
- CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)

Vulnerability Detection Method
Checks the used SSL protocols of the services provided by this system.
Details: `SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection`
OID:1.3.6.1.4.1.25623.1.0.111012

Medium (CVSS: 5.9)

NVT: SSL/TLS: Report Weak Cipher Suites

Product detection result

```
cpe:/a:ietf:transport_layer_security
Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.
↪802067)
```

Summary

This routine reports all weak SSL/TLS cipher suites accepted by a service.

Quality of Detection (QoD): 98%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
'Weak' cipher suites accepted by this service via the SSLv3 protocol:
TLS_RSA_WITH_RC4_128_SHA
'Weak' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_RSA_WITH_RC4_128_SHA
```

Impact
This could allow remote attackers to obtain sensitive information or have other, unspecified impacts.

Solution:
Solution type: Mitigation
The configuration of this services should be changed so that it does not accept the listed weak cipher suites anymore.
Please see the references for more resources supporting you with this task.

Affected Software/OS
All services providing an encrypted communication using weak SSL/TLS cipher suites.

Vulnerability Insight
These rules are applied for the evaluation of the cryptographic strength:
- RC4 is considered to be weak (CVE-2013-2566, CVE-2015-2808)
- Ciphers using 64 bit or less are considered to be vulnerable to brute force methods and therefore considered as weak (CVE-2015-4000)
- 1024 bit RSA authentication is considered to be insecure and therefore as weak
- Any cipher considered to be secure for only the next 10 years is considered as medium
- Any other cipher is considered as strong

Vulnerability Detection Method
Checks previous collected cipher suites.
NOTE: No severity for SMTP services with 'Opportunistic TLS' and weak cipher suites on port 25/tcp is reported. If too strong cipher suites are configured for this service the alternative would be to fall back to an even more insecure cleartext communication.
Details: `SSL/TLS: Report Weak Cipher Suites`
OID:1.3.6.1.4.1.25623.1.0.103440
Version used: `2025-03-27T05:38:50Z`

Medium (CVSS: 5.3)

NVT: SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048 bits

Summary

The remote SSL/TLS server certificate and/or any of the certificates in the certificate chain is using a RSA key with less than 2048 bits.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The remote SSL/TLS server is using the following certificate(s) with a RSA key w
↪ith less than 2048 bits (public-key-size:public-key-algorithm:serial:issuer):
1024:RSA:00FAF93A4C7FB6B9CC:1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D
↪626173652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for C
↪omplication of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no su
↪ch thing outside US,C=XX (Server certificate)
```

Impact

Using certificates with weak RSA key size can lead to unauthorized exposure of sensitive information.

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: Mitigation
Replace the certificate with a stronger key and reissue the certificates it signed.

Vulnerability Insight
SSL/TLS certificates using RSA keys with less than 2048 bits are considered unsafe.

Vulnerability Detection Method
Checks the RSA keys size of the server certificate and all certificates in chain for a size < 2048 bit.
Details: `SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048.`

OID: 1.3.6.1.4.1.25623.1.0.103692)

Medium (CVSS: 5.0)

NVT: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)

Summary
The remote SSL/TLS service is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 70%

Vulnerability Detection Result

```
The following indicates that the remote SSL/TLS service is affected:
Protocol Version | Successful re-done SSL/TLS handshakes (Renegotiation) over an
↪ existing / already established SSL/TLS connection
--------------------------------------------------------------------------------
↪---------------------------------------------------
TLSv1.0          | 10
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

The flaw might make it easier for remote attackers to cause a DoS (CPU consumption) by performing many renegotiations within a single connection.

Solution:
Solution type: VendorFix
Users should contact their vendors for specific patch information.
A general solution is to remove/disable renegotiation capabilities altogether from/in the affected SSL/TLS service.

Affected Software/OS
Every SSL/TLS service which does not properly restrict client-initiated renegotiation.

Vulnerability Insight
The flaw exists because the remote SSL/TLS service does not properly restrict client-initiated renegotiation within the SSL and TLS protocols.
Note: The referenced CVEs are affecting OpenSSL and Mozilla Network Security Services (NSS) but both are in a DISPUTED state with the following rationale:
> It can also be argued that it is the responsibility of server deployments, not a security library, to prevent or limit renegotiation when it is inappropriate within a specific environment.
Both CVEs are still kept in this VT as a reference to the origin of this flaw.

Vulnerability Detection Method
Checks if the remote service allows to re-do the same SSL/TLS handshake (Renegotiation) over an existing / already established SSL/TLS connection.
Details: `SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)`

NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection

Product detection result

```
cpe:/a:ietf:transport_layer_security:1.0
Detected by SSL/TLS: Version Detection (OID: 1.3.6.1.4.1.25623.1.0.105782)
```

Summary

It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.

Quality of Detection (QoD): 98%

Vulnerability Detection Result

```
The service is only providing the deprecated TLSv1.0 protocol and supports one o
↪r more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report S
↪upported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.
```

Impact

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.

Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:

Solution type: Mitigation

It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols.

Please see the references for more resources supporting you with this task.

Affected Software/OS

- All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols
- CVE-2023-41928: Kiloview P1 4G and P2 4G Video Encoder
- CVE-2024-41270: Gorush v1.18.4
- CVE-2025-3200: Multiple products from Wiesemann & Theis

Vulnerability Insight

The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like:

- CVE-2011-3389: Browser Exploit Against SSL/TLS (BEAST)
- CVE-2015-0204: Factoring Attack on RSA-EXPORT Keys Padding Oracle On Downgraded Legacy Encryption (FREAK)

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size $<$ 2048).

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Server Temporary Key Size: 1024 bits
```

Impact

An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:

Solution type: Workaround

- Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group. Please see the references for more resources supporting you with this task.
- For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Affected Software/OS

All services providing an encrypted communication using Diffie-Hellman groups with insufficient strength.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method

Checks the DHE temporary public key size.

Details: `SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerabili.`

↪ng outside US,C=XX
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Signature Algorithm:  sha1WithRSAEncryption
```

Solution:
Solution type: Mitigation
Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

Vulnerability Insight
The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:
- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)
- Message Digest 4 (MD4)
- Message Digest 2 (MD2)
Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.
NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:
Fingerprint1
or
fingerprint1, Fingerprint2

Vulnerability Detection Method
Check which hashing algorithm was used to sign the remote SSL/TLS certificate.
Details: `SSL/TLS: Certificate Signed Using A Weak Signature Algorithm`

NVT: Samba 3.0.0 <= 3.0.25rc3 MS-RPC Remote Shell Command Execution Vulnerability - Active Check

. . . continues on next page . . .

. . . continued from previous page . . .

Product detection result

```
cpe:/a:samba:samba:3.0.20
Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
```

Summary

Samba is prone to a vulnerability that allows attackers to execute arbitrary shell commands because the software fails to sanitize user-supplied input.

Quality of Detection (QoD): 99%

Vulnerability Detection Result

```
By sending a special crafted SMB request it was possible to execute ‘‘ping -p 5f
↪4f70656e5641535654313537313253f -c50 192.168.200.4‘‘ on the remote host.
Received answer (ICMP "Data" field):
0x00:  14 41 04 69 42 07 06 00 56 54 31 35 37 31 32 5F    .A.iB...VT15712_
0x10:  5F 4F 70 65 6E 56 41 53 56 54 31 35 37 31 32 5F    _OpenVASVT15712_
0x20:  5F 4F 70 65 6E 56 41 53 56 54 31 35 37 31 32 5F    _OpenVASVT15712_
0x30:  5F 4F 70 65 6E 56 41 53                            _OpenVAS
```

Impact

An attacker may leverage this issue to execute arbitrary shell commands on an affected system with the privileges of the application.

Solution:

Solution type: VendorFix

Updates are available. Please see the referenced vendor advisory.

Affected Software/OS

Samba versions 3.0.0 through 3.0.25rc3.

Vulnerability Detection Method

Sends a crafted SMB request and checks if the target is connecting back to the scanner host.

Note: For a successful detection of this flaw the scanner host needs to be able to directly receive ICMP echo requests from the target.

Details: `Samba 3.0.0 <= 3.0.25rc3 MS-RPC Remote Shell Command Execution Vulnerability - .`

2.1.14 Medium 21/tcp

Medium (CVSS: 6.4)

NVT: Anonymous FTP Login Reporting

Summary

Reports if the remote FTP Server allows anonymous logins.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
It was possible to login to the remote FTP service with the following anonymous
↪account(s):
anonymous:anonymous@example.com
ftp:anonymous@example.com
```

Impact

Based on the files accessible via this anonymous FTP login and the permissions of this account an attacker might be able to:
- gain access to sensitive files
- upload or delete files.

Solution:

Solution type: Mitigation

If you do not want to share files, you should disable anonymous logins.

Vulnerability Insight

A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data.

Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Method
Details: Anonymous FTP Login Reporting

Medium (CVSS: 4.8)

NVT: FTP Unencrypted Cleartext Login

Summary
The remote host is running a FTP service that allows cleartext logins over unencrypted connections.

Quality of Detection (QoD): 70%

Vulnerability Detection Result

```
The remote FTP service accepts logins without a previous sent 'AUTH TLS' command
↪. Response(s):
Non-anonymous sessions: 331 Please specify the password.
Anonymous sessions:     331 Please specify the password.
```

Impact
An attacker can uncover login names and passwords by sniffing traffic to the FTP service.

Solution:
Solution type: Mitigation
Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.

Vulnerability Detection Method
Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command.
Details: FTP Unencrypted Cleartext Login
OID:1.3.6.1.4.1.25623.1.0.108528

[return to 192.168.200.5]

2.1.15 Medium 22/tcp

Medium (CVSS: 5.3)

NVT: Weak Key Exchange (KEX) Algorithm(s) Supported (SSH)

Product detection result

```
cpe:/a:ietf:secure_shell_protocol
Detected by SSH Protocol Algorithms Supported (OID: 1.3.6.1.4.1.25623.1.0.105565
↪)
```

Summary

The remote SSH server is configured to allow / support weak key exchange (KEX) algorithm(s).

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The remote SSH server supports the following weak KEX algorithm(s):
KEX algorithm                          | Reason
--------------------------------------------------------------------------------
↪-----------
diffie-hellman-group-exchange-sha1 | Using SHA-1
diffie-hellman-group1-sha1         | Using Oakley Group 2 (a 1024-bit MODP group
↪) and SHA-1
```

Impact

An attacker can quickly break individual connections.

Solution:

Solution type: Mitigation

Disable the reported weak KEX algorithm(s)

- 1024-bit MODP group / prime KEX algorithms:

Alternatively use elliptic-curve Diffie-Hellmann in general, e.g. Curve 25519.

Vulnerability Insight

- 1024-bit MODP group / prime KEX algorithms:

Millions of HTTPS, SSH, and VPN servers all use the same prime numbers for Diffie-Hellman key exchange. Practitioners believed this was safe as long as new key exchange messages were generated for every connection. However, the first step in the number field sieve-the most efficient algorithm for breaking a Diffie-Hellman connection-is dependent only on this prime.

A nation-state can break a 1024-bit prime.

Vulnerability Detection Method

Checks the supported KEX algorithms of the remote SSH server.

Currently weak KEX algorithms are defined as the following:

- non-elliptic-curve Diffie-Hellmann (DH) KEX algorithms with 1024-bit MODP group / prime
- ephemerally generated key exchange groups uses SHA-1

. . . continues on next page . . .

. . . continued from previous page . . .

- using RSA 1024-bit modulus key

↪gorithm(s):
3des-cbc
aes128-cbc
aes192-cbc
aes256-cbc
arcfour
arcfour128
arcfour256
blowfish-cbc
cast128-cbc
rijndael-cbc@lysator.liu.se
```

Solution:
Solution type: Mitigation
Disable the reported weak encryption algorithm(s).

Vulnerability Insight
- The 'arcfour' cipher is the Arcfour stream cipher with 128-bit keys. The Arcfour cipher is believed to be compatible with the RC4 cipher [SCHNEIER]. Arcfour (and RC4) has problems with weak keys, and should not be used anymore.
- The 'none' algorithm specifies that no encryption is to be done. Note that this method provides no confidentiality protection, and it is NOT RECOMMENDED to use it.
- A vulnerability exists in SSH messages that employ CBC mode that may allow an attacker to recover plaintext from a block of ciphertext.

Vulnerability Detection Method
Checks the supported encryption algorithms (client-to-server and server-to-client) of the remote SSH server.
Currently weak encryption algorithms are defined as the following:
- Arcfour (RC4) cipher based algorithms
- 'none' algorithm
- CBC mode cipher based algorithms
Details: `Weak Encryption Algorithm(s) Supported (SSH)`

2.1.16 Medium 80/tcp

Medium (CVSS: 6.8)

NVT: TWiki Cross-Site Request Forgery Vulnerability (Sep 2010)

Summary
TWiki is prone to a cross-site request forgery (CSRF) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 01.Feb.2003
Fixed version:     4.3.2
```

Impact
Successful exploitation will allow attacker to gain administrative privileges on the target application and can cause CSRF attack.

Solution:
Solution type: VendorFix
Upgrade to TWiki version 4.3.2 or later.

Affected Software/OS
TWiki version prior to 4.3.2

Vulnerability Insight
Attack can be done by tricking an authenticated TWiki user into visiting a static HTML page on another side, where a Javascript enabled browser will send an HTTP POST request to TWiki, which in turn will process the request as the TWiki user.

Vulnerability Detection Method
Details: TWiki Cross-Site Request Forgery Vulnerability (Sep 2010)

```

Medium (CVSS: 6.1)

NVT: jQuery < 1.9.0 XSS Vulnerability

Summary
jQuery is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection (QoD): 80%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 1.3.2
Fixed version:     1.9.0
Installation
path / port:       /mutillidae/javascript/ddsmoothmenu/jquery.min.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://192.168.200.5/mutillidae/javascript/ddsmoothmenu/jquer
↪y.min.js
- Referenced at:   http://192.168.200.5/mutillidae/
```

Solution:
Solution type: VendorFix
Update to version 1.9.0 or later.

Affected Software/OS
jQuery prior to version 1.9.0.

Vulnerability Insight
The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `jQuery < 1.9.0 XSS Vulnerability`

NVT: HTTP Debugging Methods (TRACE/TRACK) Enabled

Summary

The remote web server supports the TRACE and/or TRACK methods. TRACE and TRACK are HTTP methods which are used to debug web server connections.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 99%

Vulnerability Detection Result

```
The web server has the following HTTP methods enabled: TRACE
```

Impact

An attacker may use this flaw to trick your legitimate web users to give him their credentials.

Solution:

Solution type: Mitigation

Disable the TRACE and TRACK methods in your web server configuration.

Please see the manual of your web server or the references for more information.

Affected Software/OS

Web servers with enabled TRACE and/or TRACK methods.

Vulnerability Insight

It has been shown that web servers supporting this methods are subject to cross-site-scripting attacks, dubbed XST for Cross-Site-Tracing, when used in conjunction with various weaknesses in browsers.

Vulnerability Detection Method

Checks if HTTP methods such as TRACE and TRACK are enabled and can be used.

Details: `HTTP Debugging Methods (TRACE/TRACK) Enabled`

Medium (CVSS: 5.3)

NVT: phpinfo() Output Reporting (HTTP)

Summary
Reporting of files containing the output of the phpinfo() PHP function previously detected via HTTP.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The following files are calling the function phpinfo() which disclose potentiall
↪y sensitive information:
http://192.168.200.5/mutillidae/phpinfo.php
Concluded from:
  <title>phpinfo()</title><meta name="ROBOTS" content="NOINDEX,NOFOLLOW,NOARCHIV
↪E" /></head>
  <tr><td class="e">Configuration File (php.ini) Path </td><td class="v">/etc/ph
↪p5/cgi </td></tr>
  <h2>PHP Variables</h2>
http://192.168.200.5/phpinfo.php
Concluded from:
  <title>phpinfo()</title><meta name="ROBOTS" content="NOINDEX,NOFOLLOW,NOARCHIV
↪E" /></head>
  <tr><td class="e">Configuration File (php.ini) Path </td><td class="v">/etc/ph
↪p5/cgi </td></tr>
  <h2>PHP Variables</h2>
```

Impact
Some of the information that can be gathered from this file includes:
The username of the user running the PHP process, if it is a sudo user, the IP address of the host, the web server version, the system version (Unix, Linux, Windows, ...), and the root directory of the web server.

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: Workaround
Delete the listed files or restrict access to them.

Affected Software/OS
All systems exposing a file containing the output of the phpinfo() PHP function.
This VT is also reporting if an affected endpoint for the following products have been identified:
- CVE-2008-0149: TUTOS
- CVE-2023-49282, CVE-2023-49283: Microsoft Graph PHP SDK
- CVE-2024-10486: Google for WooCommerce plugin for WordPress

Vulnerability Insight
Many PHP installation tutorials instruct the user to create a file called phpinfo.php or similar containing the phpinfo() statement. Such a file is often left back in the webserver directory.

Vulnerability Detection Method
This script reports files identified by the following separate VT: 'phpinfo() Output Detection (HTTP)' (OID: 1.3.6.1.4.1.25623.1.0.108474).
Details: `phpinfo() Output Reporting (HTTP)`
OID:1.3.6.1.4.1.25623.1.0.11229
Version used: `2025-07-09T05:43:50Z`

NVT: awiki <= 20100125 Multiple LFI Vulnerabilities - Active Check

Summary
awiki is prone to multiple local file include (LFI) vulnerabilities because it fails to properly sanitize user-supplied input.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
`Vulnerable URL: http://192.168.200.5/mutillidae/index.php?page=/etc/passwd`

Impact
An attacker can exploit this vulnerability to obtain potentially sensitive information and execute arbitrary local scripts in the context of the webserver process. This may allow the attacker to compromise the application and the host.

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
awiki version 20100125 and prior.

Vulnerability Detection Method
Sends a crafted HTTP GET request and checks the response.
Details: `awiki <= 20100125 Multiple LFI Vulnerabilities - Active Check`

. . . continues on next page . . .

. . . continued from previous page . . .

```

Medium (CVSS: 4.8)

NVT: Cleartext Transmission of Sensitive Information via HTTP

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The following input fields were identified (URL:input name):
http://192.168.200.5/dvwa/login.php:password
http://192.168.200.5/phpMyAdmin/:pma_password
http://192.168.200.5/phpMyAdmin/?D=A:pma_password
http://192.168.200.5/twiki/bin/view/TWiki/TWikiUserAuthentication:oldpassword
```

Impact

An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.

Solution:

Solution type: Workaround

Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.

Affected Software/OS

Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.

Vulnerability Detection Method

Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection.
The script is currently checking the following:
- HTTP Basic Authentication (Basic Auth)
- HTTP Forms (e.g. Login) with input field of type 'password'
Details: `Cleartext Transmission of Sensitive Information via HTTP`

Medium (CVSS: 4.3)

NVT: jQuery < 1.6.3 XSS Vulnerability

Summary

jQuery is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 1.3.2
Fixed version:     1.6.3
Installation
path / port:       /mutillidae/javascript/ddsmoothmenu/jquery.min.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://192.168.200.5/mutillidae/javascript/ddsmoothmenu/jquer
↪y.min.js
- Referenced at:   http://192.168.200.5/mutillidae/
```

Solution:

Solution type: VendorFix

Update to version 1.6.3 or later.

Affected Software/OS

jQuery prior to version 1.6.3.

Vulnerability Insight

Cross-site scripting (XSS) vulnerability in jQuery before 1.6.3, when using location.hash to select elements, allows remote attackers to inject arbitrary web script or HTML via a crafted tag.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `jQuery < 1.6.3 XSS Vulnerability`

OID:1.3.6.1.4.1.25623.1.0.141637

Medium (CVSS: 4.3)

NVT: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability

Summary
phpMyAdmin is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Successful exploitation will allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
phpMyAdmin version 3.3.8.1 and prior.

Vulnerability Insight
The flaw is caused by input validation errors in the 'error.php' script when processing crafted BBcode tags containing '@' characters, which could allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.

Vulnerability Detection Method
Details: `phpMyAdmin 'error.php' Cross Site Scripting Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.801660

. . . continues on next page . . .

. . . continued from previous page . . .

```
cpe:/a:apache:http_server:2.2.8
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary
Apache HTTP Server is prone to a cookie information disclosure vulnerability.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Successful exploitation will allow attackers to obtain sensitive information that may aid in further attacks.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server version 2.2.22 or later.

Affected Software/OS
Apache HTTP Server versions 2.2.0 through 2.2.21.

Vulnerability Insight
The flaw is due to an error within the default error response for status code 400 when no custom ErrorDocument is configured, which can be exploited to expose 'httpOnly' cookies.

Vulnerability Detection Method
Details: `Apache HTTP Server 'httpOnly' Cookie Information Disclosure Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.902830

[return to 192.168.200.5]

2.1.17 Medium 5900/tcp

Medium (CVSS: 4.8)

NVT: VNC Server Unencrypted Data Transmission

Summary
The remote host is running a VNC server providing one or more insecure or cryptographically weak Security Type(s) not intended for use on untrusted networks.

Quality of Detection (QoD): 70%

Vulnerability Detection Result

```
The VNC server provides the following insecure or cryptographically weak Securit
↪y Type(s):
2 (VNC authentication)
```

Impact
An attacker can uncover sensitive data by sniffing traffic to the VNC server.

Solution:
Solution type: Mitigation
Run the session over an encrypted channel provided by IPsec [RFC4301] or SSH [RFC4254]. Some VNC server vendors are also providing more secure Security Types within their products.

Vulnerability Detection Method
Details: `VNC Server Unencrypted Data Transmission`
OID:1.3.6.1.4.1.25623.1.0.108529
Version used: `2023-07-12T05:05:04Z`

References
`url: https://tools.ietf.org/html/rfc6143#page-10`

[return to 192.168.200.5]

2.1.18 Low general/icmp

Low (CVSS: 2.1)

NVT: ICMP Timestamp Reply Information Disclosure

Summary

The remote host responded to an ICMP timestamp request.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The following response / ICMP packet has been received:
- ICMP Type: 14
- ICMP Code: 0
```

Impact

This information could theoretically be used to exploit weak time-based random number generators in other services.

Solution:

Solution type: Mitigation

Various mitigations are possible:

- Disable the support for ICMP timestamp on the remote host completely
- Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)

Vulnerability Insight

The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.

Vulnerability Detection Method

Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received.

Details: `ICMP Timestamp Reply Information Disclosure`

OID:1.3.6.1.4.1.25623.1.0.103190

Version used: `2025-01-21T05:37:33Z`

References

[return to 192.168.200.5]

2.1.19 Low 5432/tcp

Low (CVSS: 3.4)

NVT: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability (POODLE)

Product detection result

```
cpe:/a:ietf:transport_layer_security
Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.
↪802067)
```

Summary

This host is prone to an information disclosure vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.

Solution:

Solution type: Mitigation

Possible Mitigations are:

- Disable SSLv3
- Disable cipher suites supporting CBC cipher modes
- Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+

Vulnerability Insight

The flaw is due to the block cipher padding not being deterministic and not covered by the Message Authentication Code

Vulnerability Detection Method

Evaluate previous collected information about this service.

Details: `SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability .`

2.1.20 Low 22/tcp

Low (CVSS: 2.6)

NVT: Weak MAC Algorithm(s) Supported (SSH)

Product detection result

```
cpe:/a:ietf:secure_shell_protocol
Detected by SSH Protocol Algorithms Supported (OID: 1.3.6.1.4.1.25623.1.0.105565
↪)
```

Summary

The remote SSH server is configured to allow / support weak MAC algorithm(s).

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The remote SSH server supports the following weak client-to-server MAC algorithm
↪(s):
hmac-md5
hmac-md5-96
hmac-sha1-96
umac-64@openssh.com
The remote SSH server supports the following weak server-to-client MAC algorithm
↪(s):
hmac-md5
hmac-md5-96
hmac-sha1-96
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
umac-64@openssh.com
```

Solution:
Solution type: Mitigation
Disable the reported weak MAC algorithm(s).

Vulnerability Detection Method
Checks the supported MAC algorithms (client-to-server and server-to-client) of the remote SSH server.
Currently weak MAC algorithms are defined as the following:
- MD5 based algorithms
- 96-bit based algorithms
- 64-bit based algorithms
- 'none' algorithm

Details: `Weak MAC Algorithm(s) Supported (SSH)`
OID:1.3.6.1.4.1.25623.1.0.105610
Version used: `2024-06-14T05:05:48Z`

[return to 192.168.200.5]

2.1.21 Low general/tcp

Low (CVSS: 2.6)

NVT: TCP Timestamps Information Disclosure

Summary
The remote host implements TCP timestamps and therefore allows to compute the uptime.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
It was detected that the host implements RFC1323/RFC7323.
The following timestamps were retrieved with a delay of 1 seconds in-between:
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Packet 1: 615218
Packet 2: 615326
```

Impact

A side effect of this feature is that the uptime of the remote host can sometimes be computed.

Solution:

Solution type: Mitigation

To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.

To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled'

Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled.

The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.

See the references for more information.

Affected Software/OS

TCP implementations that implement RFC1323/RFC7323.

Vulnerability Insight

The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.

Vulnerability Detection Method

Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.

Details: `TCP Timestamps Information Disclosure`
